

*Gorgosaurus nov. sp.**Fossil Replica**Purchase or Lease*

Order: Saurichia
Suborder: Theropoda
Family: Tyrannosauridae
Genus: *Gorgosaurus*
Species: undescribed

Campanian - Late Cretaceous
 80 MYBP
 Two Medicine Formation
 Teton County, Montana

A smaller cousin of *T. rex*, this specimen is one of the most complete skulls and skeletons for ANY theropod known to date. Preservation of the bones is superb. The skull was taken completely apart, cleaned and rearticulated so that all parts are visible.

Details on Back

Gorgosaurus nov. sp.

Fossil Replica

Specimen Background

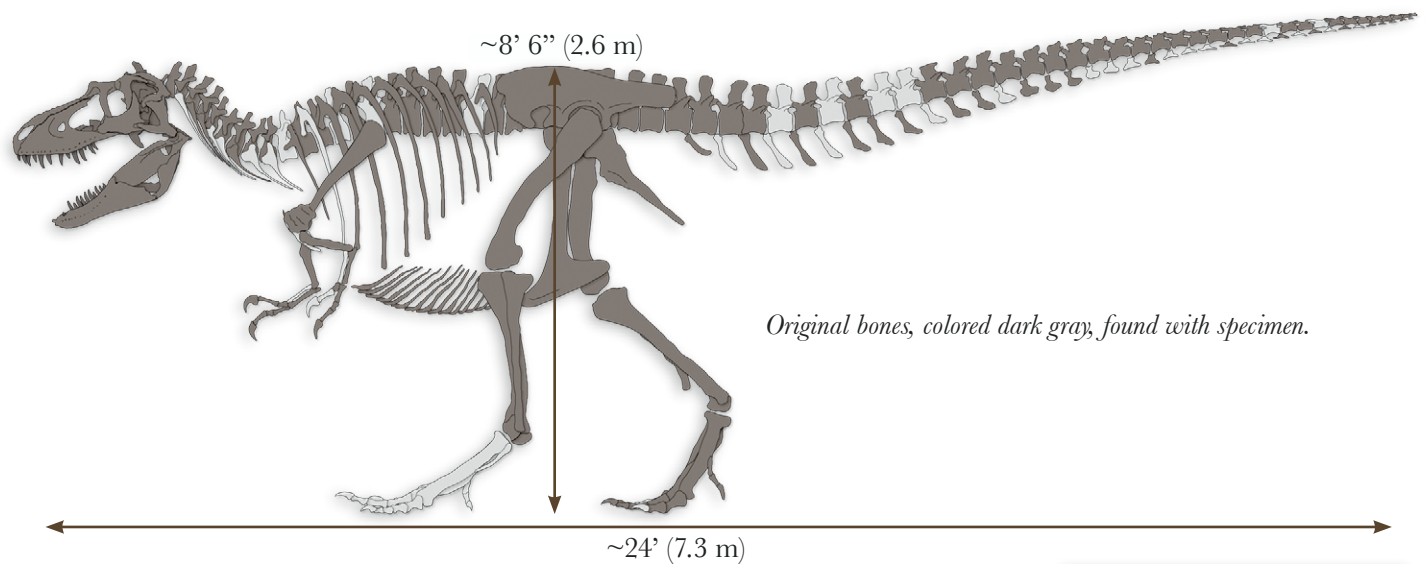

Discovered and collected by the Linster family from within a *Maiasaura* bone bed. Prepared, molded and mounted by BHI for The Children's Museum of Indianapolis, where it went on exhibit June, 2004 (specimen # TCM 2001.89.1).

Replica Details

This replica presents many pathologies (evidence of disease or healed injuries) that tell a provocative story of the gorgosaur's life. These include broken and healed bones, active infections, and the first and only documented case of a dinosaur *brain tumor*. This specimen, more than any other, documents the hard life of tyrannosaurs.

Original posed guarding the carcass of a *Maiasaura*. Any physiologically possible pose is available.

Overall Size

Length of running pose: 24' (7.3 m); height at hips (dependant on pose): 8' 6" (2.6 m).

Related Items

Available cast replicas include skull, braincase (with tumor), and most individual bones or assemblages.
